Advanced Anabolic Mastery — Competition Prep + HGH

Advanced protocols are used by competitive bodybuilders in the off-season and contest prep phases. These involve multiple compounds, growth hormone, peptides, and careful management of every hormonal variable. This guide is for educational understanding of professional competitive bodybuilding practices.

Off-Season Mass Protocol

Compound	Dose	Duration	Purpose
Testosterone Enanthate	600–750 mg/wk	24 weeks	Anabolic base
Nandrolone Decanoate	400–600 mg/wk	20 weeks	Mass + joint support
HGH (Somatropin)	4 IU/day	24 weeks	IGF-1, recovery, fat
Insulin (Humalog)	4–8 IU post-workout	Training days	Nutrient partitioning
Cabergoline	0.5 mg/2x wk	Duration of Deca	Prolactin control
Arimidex	1 mg EOD	Throughout	Estrogen management
HCG	1000 IU/2x wk	Until 4 wks pre-PCT	HPTA preservation

Contest Prep Protocol — 16 Weeks Out

Weeks Out	Compounds	Changes	Focus
16–12	Test-E + Deca + HGH	Add Anavar 50 mg	Maintain mass, begin cut
12–8	Test-P + NPP + HGH + Anavar	Drop Deca, switch to short esters	Dry out, sharpen
8–4	Test-P + Masteron + Anavar + Winstrol	Drop NPP, add Masteron	Hardness + vascularity
4–1	Low Test + Mast + Winstrol	Peak week protocol	Water manipulation
Peak week	Manipulation protocol	Carb load + water taper	Maximum conditioning

HGH Administration Guide

Parameter	Detail
Standard dose	2–4 IU/day (recreational); 4–6 IU (competitor)
Injection timing	Fasted AM or post-workout for fat loss; pre-bed for recovery/GH pulse
Reconstitution	1 mL BAC water per 10 IU kit; rotate injection sites
Side effects	Carpal tunnel (transient), water retention, blood glucose elevation
IGF-1 monitoring	Ideal range on HGH: 250–450 ng/mL; test every 6 weeks
Cost (India)	■8,000–25,000/month depending on brand and dose

Cardiovascular Health Management

Advanced cycles significantly impact cardiovascular health. This is the most critical risk factor and requires active management.

Risk	Mechanism	Monitoring	Mitigation
LVH (left ventricular hypertrophy)	Androgen-driven cardiac muscle growth	Echocardiogram annually	Limit cycle length
Polycythemia	Elevated RBC/hematocrit	CBC every 6 weeks	Therapeutic phlebotomy
Dyslipidemia	Oral steroids crush HDL	Lipid panel every cycle	Fish oil 4 g, statins if needed
Hypertension	Fluid retention + vasoconstriction	Weekly BP monitoring	AI, sodium control, cardio

Peak Week Water Manipulation

Day	Water	Carbs	Sodium	Purpose
Day 7	High 7L	Low	Normal	Begin water loading
Day 6	7L	Low→Moderate	Low	Continue water loading
Day 5	6L	Moderate	Low	Begin carb increase
Day 4	5L	High	Minimal	Glycogen loading
Day 3	4L	High	Minimal	Peak glycogen
Day 2	2L	Moderate	Minimal	Begin water restriction
Day 1 (show)	Sips only	Low-GI if flat	0	Maximum conditioning
